

NEWS BULLETIN NB01-2019

New EPIRB programming/coding software released, TronLink EPIRB!

We have the pleasure to announce that our completely re-designed EPIRB programming software is ready to be released! The new software will make it easier to program the Jotron range of EPIRBs.

The new software is designed to be highly user friendly making it easy to code Jotron EPIRB's in a streamlined fashion, with less chance of errors than in older PR40 Software.

You no longer need to enter information in different Tabs, but everything is performed within a wizard from a to z .

Improvements/enhancements compared to older PR40 software:

- Automatically identifies type of EPIRB undergoing programming
- Automatic serial number identification, not necessary to manually input
- Reads previous coding to make it easier to adjust values and write back to EPIRB
- Selection of bracket types by name and pictures
- Selection of country by name or number
- Calculation of battery expiry date based on battery manufacturer date

Please note new requirements for this software:

- Windows 7 or newer
- Resolution: 1152 x 864 or higher (will be possible to use on 1366 x 768 too)
- No longer compatible with older programmer with serial port, PRU-40, needs PRU-USB or PRU-50

Old PR40 software:

- This will not be updated anymore, last version is 3.8.6 from 2015
- Will function until further notice on EPIRBs without GPS.
- EPIRBs with GPS will be limited to serial numbers up to 16383. (Tron 40VDR will reach this limit possibly summer 2019)
